

## DVD-R Media – Bit Rates in Megabytes

---

The maximum DVD-R playback bit rate in megabytes per second depends upon the drive speed.

The following examples provide bit rates for 10X and 16X DVD-ROM drives.

- DVD-114 (10X DVD-ROM) = 13.5 MB/s
- DVD-115 (16X DVD-ROM) = 21.6 MB/s

When recording to or playing back a DVD-R disc, the bit rate may fluctuate. One or more of the following factors can cause bit rate changes.

- Available resources
- System configuration
- Where the disc is being read (inner or outer radius)  
*data rate is faster towards the outer radius of a disc and slower towards the inner radius*
